WHO WE ARE

Regeneron is a global biotechnology company that invents life-transforming medicines for people with serious diseases

REGENERON
SCIENCE TO MEDICINE®

TECHNOLOGY LEADER

- Proprietary *VelociSuite®* technologies were designed to address drug **development bottlenecks and enable targeted, efficient study of diseases** and the creation of new therapeutics[1]
- The Regeneron Genetics Center®, one of the world's largest integrated programs of its kind, was created to enable a deeper understanding of how human genetics may impact disease[1]

VELOCISUITE®

VELOCIMOUSE® VELOCI-BI®
VELOCIGENE® VELOCIHUM®
VELOCIMAB® VELOCIT®
VELOCIMMUNE® VELOCINATOR™
VELOCIVAX™

VELOCIGENE®

- The foundation of many steps in the development process
- A high-throughput approach utilizing BAC (bacterial artificial chromosome) vectors that can generate precise alterations of very large stretches (>75 kb) of genetic information[2]

VELOCIMMUNE®

- Accelerates the development of fully human antibodies[4]
- VelocImmune mice express the human variable Ig regions and were generated using VelociMouse[5]

VELOCIMAB®

- Allows rapid antibody candidate selection and generation of production cell lines[8]
- Enables antibody production at scale[8]

VELOCIHUM®

- Regeneron's immunodeficient mouse platform that allows accurate testing of human therapeutics[8]

VELOCIMOUSE®

- Enables accelerated generation of genetically modified mice[3]
- Used with VelociGene to generate murine disease models, validate targets, and test drug candidates[3]

VELOCI-BI®

- Full-length, human bispecific antibodies amenable to standard antibody manufacturing techniques[6,7]
- Pharmacokinetic properties similar to natural antibodies[6,7]

VELOCIT®

- Assists in the creation of fully human therapeutic TCRs (T-cell receptors) against tumor and viral antigens[9]

VELOCINATOR™

- Enables drug discovery through identification of therapeutic target pairings and optimization of bridging antibody-binding domains[8]
- Being investigated in enzyme replacement therapies and oncology and genetic medicines[8]

VELOCIVAX™

- Enables generation and validation of potential messenger RNA-based therapeutics in-house to support the preclinical advancement of vaccine and immune-modulating technologies[8]
- Proprietary platform allows teams to iterate quickly, combine new mRNA candidates with our broader oncology toolkit (including bispecific antibodies and checkpoint inhibitors), and to explore future applications in other therapeutic areas[8]

The Regeneron Genetics Center, home to the largest and most diverse genomic database in the world[1]

Leveraging internal resources to identify drug targets

The primary goal is to improve patient outcomes by identifying novel drug targets, clinical indications for development programs, and genomic biomarkers for pharmacogenomic applications[2]

~2.7M+ exomes sequenced and counting

650K+ underrepresented individuals sequenced

150+ research collaborations

RGC®
Regeneron Genetics Center

6 genetic medicine programs in the clinic

~30 therapeutic programs started from novel RGC targets or known genes with novel RGC insights

25+ novel genetic targets discovered
